A Frame-semantic
Contrastive Text Analysis:
Toward Representation of Lexicon and Grammar
in FrameNets

Kyoko Hirose Ohara

1. Introduction

This paper discusses findings of a frame-semantic contrastive text analysis of English and Japanese, using the large-scale and precise descriptions of semantic frames provided by the FrameNet project (Baker 2006, Fillmore 2006, Fontenelle 2003).\footnote{Even though the official name of the project is “FrameNet,” in this paper the term “English FrameNet” is also used, in order to emphasize the fact that we are contrasting Japanese with English. There exist Spanish FrameNet and German FrameNet, in addition to Japanese FrameNet, which employ similar methodologies in lexicon building and which work closely with the FrameNet project.} FrameNet is a lexicon-building project, which has been analyzing meanings of English lexical units in terms of the semantic frames they evoke. It annotates corpus example sentences with frame-semantic analyses and incorporates them into the lexicon. This paper points out that even though the FrameNet methodology allows us to compare languages at a more detailed level than previous studies, in order to investigate how different languages encode the same events, it is necessary for the frame-semantic lexicon to specify the grammatical affordances of its entries. Based on a contrastive text analysis of an English-Japanese aligned parallel
corpus and on the lexicon-building project of Japanese FrameNet (Ohara et al. 2006), the paper proposes a way to record cross-referencing between lexicon and grammar, as an extension of the current FrameNet and Japanese FrameNet methodologies.

The rest of the paper is structured as follows. Section 2 gives a background to the study, by first giving brief introductions to Frame Semantics and to the English and Japanese FrameNet projects, which are the basis of the present study. It then summarizes a previous analysis, which adopted the FrameNet methodology in order to contrast texts in different languages. After the problems with the previous study are presented in Section 3, Section 4 proposes how the problems can be solved by extending the current FrameNet and the Japanese FrameNet methodologies. Finally, Section 5 concludes the discussion.

2. Background

2.1. Frame Semantics and the English and the Japanese FrameNets
Frame Semantics, originating in Fillmore’s seminal papers in 1970’s (e.g. Fillmore 1976), is a research program in empirical semantics which emphasizes the links between language and experience. In Frame Semantics, each word is described in terms of the conceptual frame it evokes. Here, frame is defined as “a script-like conceptual structure that describes a particular type of situation, object, or event along with its participants and props” (Ruppenhofer, et al. 2006: 5). In this respect, the term frame in Frame Semantics refers to something different from the term case frame in Fillmore’s

---

2 It should be noted in passing that the term frame is used differently in natural language processing in which it is used to refer to a syntactic frame in which a verb occurs.
earlier Case Grammar, although Frame Semantics should be understood as a refinement and reformulation of Case Grammar (e.g. Fillmore 1968). In Case Grammar, a case frame initially referred to a set of very abstract case roles that a verb can take, such as agent and patient. It was, however, recognized later that abstract case roles are insufficient to characterize all the different types of interactions of participants that are encoded linguistically (Hasegawa and Ohara 2006, Baker 2006).

Notions comparable to frame in Frame Semantics have developed in other fields, especially in artificial intelligence and cognitive psychology. Frame as used by Marvin Minsky is more or less similar to the concept of frame in Frame Semantics. Roger Shank’s term script to talk about situations such as eating in a restaurant is also related to the concept of frame. In discourse analysis, the term frame was used by Erving Goffman and has been popularized more recently in books by Deborah Tannen and by George Lakoff. Frame as used in Frame Semantics, however, refers to any system of linguistic choices that can be get associated with prototypical instances of scenes (including not only visual scenes but also familiar kinds of interpersonal transactions, standard scenarios, familiar layouts, institutional structures, enactive experiences, body image, and in general, any kind of coherent segment, large or small, of human beliefs, actions, experiences, or imaginings). In other words, frames are basically linguistic, while scenes are basically cognitive. In English and Japanese FrameNets, which will be discussed in the following two sections, building a lexicon thus involves defining frames connected to language.

The FrameNet project is creating an on-line lexical resource for

---

3 Fillmore acknowledges that Ronald W. Langacker’s base and profile are also similar in meaning with frame (Hasegawa and Ohara 2006: 36).
English, based on Frame Semantics and supported by corpus evidence. The aim of the project is to document the range of semantic and syntactic combinatorial possibilities (valences) of each word in each of its senses, through computer-assisted annotation of example sentences and automatic tabulation and display of the annotation results (http://framenet.icsi.berkeley.edu/).

Active research projects are now seeking to produce comparable frame-semantic lexicons for other languages, and Japanese FrameNet is one of them. The goal of Japanese FrameNet is to create a prototype of an online Japanese lexical resource in the FrameNet style, by describing the senses of each word with respect to the semantic frames it evokes and by annotating corpus examples of each word with frame-semantic tags. Important research questions being asked by Japanese FrameNet are: to what extent is the Frame-semantic approach suitable for analyzing the Japanese lexicon; and to what extent are the existing English-based semantic frames applicable to characterizing Japanese lexical units. Also, while purporting to retain the richness of semantic information in FrameNet, Japanese FrameNet pays close attention to typological differences in lexicalization patterns between Japanese and English (http://jfn.st.hc.keio.ac.jp/).

2.2. A Previous Analysis

Ellsworth et al. 2006 contrasted semantic frames involved in motion descriptions in an English novel and its corresponding Japanese, Spanish, and German translations, using the semantic frames defined in English FrameNet. They found regularities of translation which had not been fully discussed previously. In the scene described in (1) below, the primary conceptualizations in English are the fog’s motion toward the viewpoint (came) and turbulent circular motion (rolled). The Japanese, however, describes the blurring of the scene (usuboyakete) and its being engulfed by the fog.
(makikom-areteitta). The linguistic materials in English encoding motion and their corresponding segments in Japanese are shown in the bold type.

(1)

E: *As we watched it the fog-wreaths came crawling round both corners of the house and rolled slowly into one dense bank, on which ...*

(ARTHUR CONAN DOYLE. 1901-02. *THE HOUND OF THE BASKERVILLES*)

J: *yagate atari wa itimen ni usuboyakete,*

soon area TOP all.around blur

*gradually fog GEN inside GOAL engulf-PASS-PAST CONJ*

‘Soon the area was blurred all around [the house] and (it) was gradually engulfed inside the fog ...’

(TRANSL. KEN NOBUHARA. 1955. *BASUKAVIRU KE NO INU*)

In the current FrameNet methodology, frame-evoking words are first identified and then the specific frames that the words evoke are examined. In the following, the frame-evoking predicates shown in bold type are labeled with the relevant frame names:

(1’)

E: *As we watched it the fog-wreaths came [Motion] crawling [Motion] round both corners of the house and rolled [Moving_in_place] slowly into one dense bank, on which ...*

J: *yagate atari wa itimenni usuboyakete [Eclipse]*

soon area TOP all.around blur

*gradually fog GEN inside GOAL engulf-PASS-PAST CONJ*
*Came* and *crawling* in the English original sentence in (1’) evoke the Motion frame and *rolled* evokes the Moving_in_place frame. The Motion frame is currently defined in English and Japanese FrameNets as “some entity starts out in one place and ends up in some other place, having covered some space between the two,” and the Moving_in_place frame as “a Theme moves with respect to a Fixed_location, generally with a certain Periodicity, without undergoing unbounded translational motion or significant alteration of configuration/shape”.

*Usuboyakeru* and *makikomu* in the Japanese translation in (1’), on the other hand, evoke the Eclipse frame and the Cause_motion frame respectively. The former is defined as “an Obstruction blocks an Eclipsed entity partially or completely from view,” while the latter is defined as “an Agent causes a Theme to undergo directed motion.”

Why does not *usuboyakete*, the Japanese segment corresponding to *came crawling*, encode motion? If we notice that the Eclipse frame (conveying blurring or hiding) describes a state which is dependent on location, we can see that the Japanese translation is describing a viewpoint implicit in the motion of the obscuring fog in English. In other words, while the English text focuses on the motion of the fog, the Japanese translation focuses on the state change of the whole scene after the fog has moved.

The above pair of sentences may well be yet another example of the contrast between focus on a part of a scene and focus on the whole scene; or

---

4 In order to examine to what extent the existing English-based semantic frames are applicable to characterizing Japanese lexical units, Japanese FrameNet keeps the same frame definitions as those in the English FrameNet as much as possible. Also, currently in Japanese FrameNet, frame definitions are written in English, in order to make them accessible for non-native speakers of Japanese and for multilingual FrameNets.
between focus on an action and focus on a state, which has been discussed by Ikegami (e.g. Ikegami 1991). Such dependencies are easily described by Frame Semantics and thus in the English-Japanese contrastive analyses based on the current English and Japanese FrameNets. In other words, the frame-semantic contrastive analyses of lexical units by Ellsworth et al. reveal detail that is not covered by Talmy and Slobin’s semantic typologies, which are based on classification of languages into verb-framed vs. satellite-framed languages (Talmy 2003, Slobin 2004).

3. Analysis

Ellsworth et al. 2006, which is based on the current FrameNet methodology, however, is limited to investigating frame-bearing predicates and thus fails to account for pairs of English and Japanese sentences such as below. In (2), the English original text does not mention motion, as seen by the fact that no motion verb is used, while a state verb lay appears in the sentence. The Japanese translation, in contrast, employs a motion verb oriru ‘fall.’

(2)
E: ... said the detective ..., glancing ... at the huge lake of fog which lay over the Grimpen Mire.

J: ... keibu wa ... gurinpen no oo-zoko-nasi numa no ue ni oriru koi kiri o miwatasita.

‘... the detective glanced at the thick fog which had fallen over the great bottomless Grimpen Mire.’
In FrameNet, *lie* is currently analyzed as a predicate evoking the *Being_located* frame (“A THEME is in a stable position with respect to a LOCATION”). In Japanese FrameNet, *oriru ‘fall’* is analyzed as evoking the *Motion_directional* frame (“A THEME moves in a certain DIRECTION which is often determined by gravity or other natural, physical forces”). According to the analysis, it thus seems as if whereas the English sentence describes a scene in terms of a state, the Japanese translation encodes the same scene as a motion. This pattern seems to be rare, although the opposite tendency (i.e., English describing a scene as a motion, while Japanese describing the same scene in terms of a state) has been noted by linguists including Ikegami (ibid., cf. Section 2).

It turns out that the Japanese sentence as a whole, however, describes a state resulting from a ‘motion’ of the fog, rather than a motion itself. In general, action verbs in Japanese, including motion verbs, cannot be used to describe a state. It is necessary to attach the auxiliary form *te iru* after the verb to describe the state which exists after an event takes place. In other words, in Japanese, an achievement verb such as *oriru*, together with the immediately following auxiliary verb *te iru*, encodes the perfect meaning of “a state exists as a result of an event” (Jacobsen 1982).

Similarly in (3), as the segments highlighted in bold show, the English original sentence employs *tied*, which evokes the *Being_attached* frame (“An ITEM is attached by a HANDLE, via a CONNECTOR, to a GOAL, or ITEMS are attached to each other.”), while the Japanese translation pertains to *sibaritukeru ‘bind,’* evoking the *Attaching* frame (“The Attaching frame covers two situations: a scene in which an AGENT causes an ITEM to be physically connected to GOAL; or a scene in which an AGENT causes two ITEMS to be connected to each other.”). Here, if we compare the semantics of the frame-evoking predicates only, then we are forced to say that whereas
English describes a state, Japanese describes an action, which again does not seem to be a preferred pattern in pairs of corresponding English and Japanese sentences.

(3)

E: To this post a figure was tied \(\text{[Being\_attached]}\) so swathed and muffled in the sheets which had been used to secure it that one could not for the moment tell whether it was that of a man or a woman.

J: kono hasira ni siitu o guruguru to makitukete, this pillar LOC sheets ACC MANNER COMPL swathed

\(\text{tyotto mita no de wa otoko ka onna ka} \)

little seeing NOM COP TOP man Q woman Q

\(\text{wakaranai ningen ga hitori sibaritu} [\text{Attaching}] \text{ te atta} \)

tell-NEG person NOM one bind RESULT

‘To this pillar a person, who was swathed in sheets and whom one could not tell whether it was a man or woman, had been bound.’

(ibid.)

It is more plausible to analyze the entire Japanese sentence as describing a state resulting from an action. That is, the verb \(\text{sibaritukeru} \), together with the auxiliary verb \(\text{te aru} \), “focuses on the resultant state of a past action rather than the action itself” (Hasegawa 2005: 229).

4. Proposal

The above examples suggest that, in order to arrive at the precise meaning of a sentence, it is necessary to be able to represent how the semantics of frame-evoking predicates interact with the semantics of the grammatical
constructions in English and Japanese FrameNets. That is, there are at least two kinds of problems of representation within the current FrameNet methodologies, namely, 1) how to show, within a lexical entry, information about how a given lexical unit fits into the grammar; and 2) how to relate grammatical constructions to the lexical units that participate in them. Based on these observations, I argue that mutual dependencies of lexicon and grammar should be introduced in the FrameNet methodology (cf. Fillmore 2006). More specifically, the annotation process of FrameNet and Japanese FrameNet should be divided into two parts, namely, annotation of lexical information and annotation of constructional information. While the former specifies grammatical affordances of lexical units, the latter specifies the kinds of lexical units capable of occurring in specifiable positions within grammatical constructions.

How these two kinds of annotation can be realized is exemplified in the two figures below. Figure 1 is an example of specification of grammatical affordances of lexical units; Figure 2 is an example of specification of lexical unit types to grammatical constructions. FrameNet and Japanese FrameNet already have a means for annotating lexical information (cf. Figure 1), while tools for annotating grammatical constructions (cf. Figure 2) have not been implemented or made available yet.

In Figure 1, when the lexical unit oriru is created in the Japanese FrameNet lexicon, the verb’s semantic type is also specified. Since oriru is an achievement verb, which refers to an instantaneous event, the semantic type of achievement is specified.

Figure 2 shows a suggested tool for annotating grammatical constructions in Japanese FrameNet. We have seen in Section 3 that achievement verbs such as oriru combine with the auxiliary form te iru to refer to a resultant state. In Figure 2, the sentence being annotated contains an instance
of *te iru*. It is selected and is about to be annotated with the name of the construction in which it participates. In the entry for the Perfect Construction, it is specified that the auxiliary verb *te iru* is preceded by a verb whose semantic type is achievement.

By devising a mechanism for annotating grammatical constructions and by making sure that interactions between lexicon and grammar are reported, it is possible to represent the meaning of an entire sentence.
5. Summary

In summary, this paper has demonstrated that the method adopted by Ellsworth et al. in their frame-based contrastive text analysis, which builds on the existing FrameNet convention to analyze only the semantics of frame-evoking predicates, is not sufficient to describe complex interactions between lexicon and grammar. Such interactions should be recorded and accounted for, in order for us to understand how languages encode the same scene differently and still allow us to come up with comparable construals of the scene, no matter in which language we read. This paper also proposed a way to represent interactions between lexical units and grammatical constructions, as an extension of the current FrameNet annotation methodologies. By addressing the necessity for representing interactions between lexicon and grammar in English and Japanese FrameNets from the viewpoints of contrastive text analysis, it is hoped that this paper will contribute to the development of “Constructicon” proposed by Fillmore 2006.

Acknowledgments

This paper is based on a poster presentation entitled “Frame Semantics in Action: A Frame-based Contrastive Text Analysis Using FrameNet,” given at the 10th International Cognitive Linguistics Conference (ICLC10) in Krakow, Poland on July 17th 2007. I would like to thank the audience at ICLC10 and my colleague Charles De Wolf for their helpful comments. All remaining errors are my own. The contrastive analysis presented in this paper was supported by Japan Society for the Promotion of Science (JSPS) under the Japan-U.S. Cooperative Science Program. Construction of a prototype of Japanese FrameNet has been supported by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) Grant-in-aid for Scien-
A Frame-semantic Contrastive Text Analysis

tific Research Priority Area Program the “Balanced Corpus of Contemporary Written Japanese (BCCWJ)” (Japanese Corpus) under the supervision of Dr. Kikuko Maekuwa.
