## Hemicholinium-3-resistant Choline Uptake System Linked to Acetylcholine Synthesis in the Rat Hippocampus\*

Takeshi SUZUKI, Yuko KASHIMA and Koichiro KAWASHIMA

鈴木岳之, 鹿島裕子, 川島紘一郎

Extracellular choline-dependency of acetylcholine (ACh) synthesis was examined in rat hippocampal slices. In the presence of hemicholinium-3 (HC-3, 5  $\mu$ M), extracellular choline-dependent ACh synthesis appeared to consist of two different components. The first component (saturated at up to 50  $\mu$ M choline) was dependent on the HC-3-resistant choline uptake system having a low capacity for choline in comparison with the high-affinity choline uptake system (HACU). The second component, observed in the presence of more than 50  $\mu$ M choline, was considered due to competitive inhibition of HACU by HC-3. HACU-dependent ACh synthesis seemed to be saturated in the presence of up to 2  $\mu$ M choline. These results indicate that both the HACU and HC-3-resistant choline uptake systems are linked to ACh synthesis in the hippocampus
